

Create the following components in your Laravel project:

1. Route `'/show/students/all'` – is a route to show all the student entries on screen. Include a show button or link for each entry.
2. Route `'/show/student/{id}'` – a route to show only the information for the individual student. This route is activated by clicking on the show option in the main list.
3. Route `'/show/colleges'` – this route will show all the colleges and their respective programs. The display is similar to the all students interface.
4. Route `'/show/college/{id}'` – a route that will only show the selected college with its respective departments and programs.
5. Route `'/show/departments'` – a route that will show all the departments in the departments table and will also show its related School/College
6. Create models for each table in the database and supply the necessary Eloquent Relationships.
7. Create a controller called `'UniversityController'` that will handle all the routes and requests.
8. Create the necessary views for each of the routes.
